# Style

## Lesson 06

THE *Style* SCOUT

Writing style

Words and expressions

Comprehensive writing

Conference preparation

Research documentation (PURE)

# Writing style

LINGOJAM

## Fancy Text Generator

A translator to convert normal text to fancy text. You can copy and paste.

This is a stylish text ...

It is not (so much) about "stylish" text ...

This is a stylish text ...

This is a stylish text ...

🐼 This is a stylish text ... 🐼

*This is a stylish text ...*

# Writing style

- It is not about the style of the formatting
  - The formatting should be as neutral as possible
  - Use 'style-guides' specified by publishing media (font size, font type etc.) or formatting style
- Personal style to be acquired by yourself and consolidated over time, hardly can be taught (read a lot and you shall find your own style ... 😊)
- Here: some general principles regarding style of **good practice**

# Good writing is ...

- » Something the reader enjoys reading ... it's easily understood.
- » Catch phrase – something that catches your interest.
- » It has a clear focus (on the research question)
- » Examples help
- » Short and clear – get to the point!
- » Short sentences (not too many dependent clauses)
- » Author builds tension, reader wants to read on.
- » Sentences should flow – should form a picture.
- » Should tell a story
- » Simplicity is good
- » Content of the text is clear by scanning

# Words and expressions

- Words are the ‘currency’ of thinking
    - The number of words at our command (in both own and foreign language) controls our thinking
      - Words can be misunderstood – or misused
    - Chose the right word / wording (not so trivial ...)
      - Often a scientific or technical term is well defined, so it should be preferred over colloquial ones
      - otherwise, chose the simplest word among several options (still sounds ‘scientific’\*?)
    - Do not confuse words yourself ... 😊
- *accept* / *except*, *effect* / *affect*,
  - *amount* (mass or volume) / *number* (counted), *fewer* / *less*, *majority* / *most*
  - *data*\*\* (observations) / *results* (obtained from data)
  - *method* (how to perform a task) / *methodology* (study of methods)
  - *while* (at the same time) / *whilst* (although)
  - *since* (from that time) / *because* (for this reason)

# Words and expressions

- We tend to think scholarly writing must be hard to understand
  - ➔ difficult to find the right balance between pure writing and style
  - Prefer short words over longer ones
  - **superfluous** words contain extra qualification
  - **Tautologies** say the same thing twice

*Practical aspect: consider word / page limit in publications or proposals! (e.g. 500 words abstract, 20 pages technical description)*

- accomplish ➔ do
- additional ➔ extra
- currently ➔ now
- demonstrate ➔ show
- encounter ➔ meet
- exhibit ➔ show
- hypothesize ➔ suggest
- indicate ➔ sign
- initiate ➔ start
- modification ➔ change
- subsequently ➔ later
- ...

- absolutely essential
- completely surrounded
- they are in fact
- few in number
- quite obvious
- real problems
- ...

- (the reason for this is) because
- related to (each other)
- each (individual) person
- a (specific) example
- We are (currently in the process of)
- grouped (together)

# Words and expressions

- Technical terms and nomenclature
  - A kind of **coding** that simplifies communication between experts / scientists (economy of words, avoid verbosity)
  - No explanation needed (if right audience addressed, otherwise may sound like technical jargon!)
  - Often (e.g. in book chapters for didactic use), a glossary may be added, technical terms (first) serve as barriers for lay persons
  - Meanings may be introduced at first time use by “*that is*” (i.e.).
- Acronyms / abbreviations
  - Abbreviations are used to shorten words
  - Acronym is a commonly agreed short form, usually comprised by initial letters of successive words (e.g. PLUS, GIS, UNEP, but also kg, mm, ...)

- Watch out e.g.  
(*exempli gratia*)  
vs. i.e. (*id est*)

# Comprehensible writing

- Type of paper
  - **Research** paper or
  - **Review** paper (incl. seminar paper)
  - ➔ does IMRaD apply?
- General statements
  - Move from general to specific : catch reader's attention – and release it later on
  - Problem: when do I enter the sphere of hypotheses, unsupported statements etc.

*"Overtime degradation and soil loss are common occurrences for agricultural landscapes"*

# Comprehensible writing

- Style elements
  - **Gendered** writing: do not exclude female users, researchers, authors, etc. use he/she at least
  - **Cautious** writing, cultural style - "should"
  - **Repetition**: "users and clients", "label or classify": is it used for intensification (non-scientific), or is it a real enumeration?
  - Careful use of 'however': strong opposite
  - Paragraphs and indents: not every sentence is a paragraph.
  - **References**: [here:] use **names** (not number, depending on style guide) in text; do not put all names, use *et al*(iena) [not aliens 😊]
  - Usage of articles (determined/non-determined).The / a vs. none

*"Well-organized process of placing labels defines rule-based annotation of map." [...] "Due to the development of the automated cartography and GIS today's methods and technologies have become automated as well".*

# Comprehensible writing

- Title
  - Should be as **informative** and **comprehensive** as possible
  - Some journals require titles to summarize the results: “*Machine learning exceeds power of human brain in counting apples.*”
  - Title as **questions**: gains attention, and some people 'swear' on it. Careful: it may sound provocative. Try not to address a normal scientific problem as a 'grand topic'.
  - The problem with questions: you need to answer them 😊
- Keywords:
  - Are used to enhance registration (librarian work), or searchability (in the web)
  - Keywords should not repeat words appearing in the title: instead of “*machine learning, human brain, apples*” use for example “*artificial intelligence, neural networks, routine tasks*”

# Comprehensible writing

- Abstract
  - Should be **comprehensive**, i.e. also including relevant info on study site, methods, results (and discussion)
  - As rule of thumb: at least one **critical statement** per part → practical approach: extract one sentence from each main chapter
  - Actual paper should not need to start with "*This paper presents...*" (may be concluding paragraph of Introduction)
  - Use past tense (but not at general statements)

# Research documentation (PURE)

## Stefan Lang

Assoz. Prof. Priv.-Doz. Mag. Dr.

# The long way to publish – an example

- 2015: conducted research
- Presented at EARSeL Symposium in 2016
- Call for Papers in Special Issue
  - Deadline announced Oct, then postponed Dec 2016
  - Publisher changed, deadline shifted to March 2017
  - Reviewed until summer 2017
  - Re-worked until Oct 2017
  - Publishing process
- Publication
  - Online: 12 Dec 2017
  - In print: early 2018

# Mini-Conference

## *"Space matters"*

19 Jan 2021 [10.00 – 12.00]

### Moderator

- Introduces presenter and title of talk
- Keeps time (5 min)
- Stimulates discussion (asks at least one question)

### Presenter

- Will go into topic right away
- Does not need to repeat own name and title
- *(changes role to moderator after presentation)*

### Assignment 4

*Final paper (scientific essay)*  
Including references and figure(s)

### Assignment 5

*Short presentation*  
3-4 slides  
+ title slide + content slide  
(brief summary, as bullet points or  
graphical abstract)

Best Paper  
Award!
